Project 3 - Schedulers

PintOS

In class, we discussed how to build a simple priority scheduler in pintOS, as well as an advanced scheduler, in which, CPU-hungry threads lose priority to avoid starvation. In the second case, the user sets a *nice* value. Priority is then automatically adjusted by the OS based on the thread's niceness.

Your task is to implement both schedulers, and you have to do it in such a way that one could choose in the PintOS initialization which scheduler will be used.

Priority Scheduler

- A *priority* is an integer ranging from 0 to 63. In the current implementation of PintOS we can already find the variables: $PRI_MIN = 0$; $PRI_DEFAULT = 31$; $PRI_MAX = 63$.
- The next thread to run is that with the highest priority. There is already a field *priority* in the thread's struct in the "threads/threads.h" file, and functions to set and get this value in the "threads/threads.c" file.
- If multiple threads have the same highest priority, the scheduler must alternate them in round-robin.

Functions to be modified

$next_thread_to_run()$	Make it return the thread with highest priority.
$thread_set_priority()$	Make the current thread yield if the new priority is not the highest.
$thread_create()$	Make the current thread yield when a higher priority thread is created.

Hints

**yield = i don't want cpu

- You will only need to modify the "threads/threads.c" file for the priority scheduler.
- The functions above represent the main locations where you could implement your solution. However, depending on your implementation, you could modify other existing functions instead. You may also need to create other auxiliary functions not mentioned above.

Advanced Scheduler

- Each thread has a *nice* value (ranging from -20 to 20, with 0 as default).
- Each thread has a *recent_cpu* value (indicating how much cpu the thread has used recently).
- Global variable *load_avg* stores the system load (in number of ready+running threads per second in the last minute)

Functions to be implemented

$thread_set_nice(int)$	Update the thread <i>nice</i> , recalculate its <i>priority</i>
(111)	based on that and yield if the new priority is not the highest anymore.
$thread_get_nice()$	Return the thread's nice value.
$thread_get_load_avg()$	Return $load_avg*100$.
$thread_get_recent_cpu()$	Return current thread's $recent_cpu * 100$.

^{*}The current thread must yield if a thread with higher priority (based on its nice value) is created.

παίρνει μόνο 2 τιμές 0 και 1. Αν πάρει 0 σημαίνει ότι είναι άδειο, ενώ αν πάρει 1 σημείνει ότι είναι γεμάτο. Αν υπερβεί το 1 σημαίνει ότι κάποιος περιμένει γιατί ο CPU Required variables

nice	Initial value is set by the user.
type: int	User can change with $thread_set_nice()$.
(per thread)	č V
$load_avg$	Initial value is 0.
type: $fixed-point\ real$	Update every second:
(global)	$load_avg = (59/60)*load_avg + (1/60)*ready_or_running_threads$
$recent_cpu$	Initial value is 0.
type: $fixed - point real$	On every tick increase $recent_cpu$ by 1 for the current thread.
(per thread)	Update every second:
(P 3 3 3 3 3 3 3)	$recent_cpu = (2*load_avg)/(2*load_avg + 1)*recent_cpu + nice$
priority	Initial value is calculated based on the initial value of <i>nice</i> .
type: int	Update every 4 ticks:
(per thread)	$priority = PRI_MAX - (recent_cpu/4) - (nice * 2)$

πόσο μέρος тои сри χρησιμοποίησε ένα thread

Tests

A correct implementation results in a decrease in the number of failed tests to 10 out of 27, and an execution of make check should print the following result:

\$ make check pass tests/threads/alarm-single pass tests/threads/alarm-multiple pass tests/threads/alarm-simultaneous pass tests/threads/alarm-priority pass tests/threads/alarm-zero pass tests/threads/alarm-negative pass tests/threads/priority-change FAIL tests/threads/priority-donate-one FAIL tests/threads/priority-donate-multiple FAIL tests/threads/priority-donate-multiple FAIL tests/threads/priority-donate-nest FAIL tests/threads/priority-donate-lower pass tests/threads/priority-donate-lower pass tests/threads/priority-fifo pass tests/threads/priority-preempt FAIL tests/threads/priority-sema FAIL tests/threads/priority-condvar FAIL tests/threads/priority-donate-chain pass tests/threads/mlfqs-load-I pass tests/threads/mlfqs-load-60 pass tests/threads/mlfqs-load-avg

10 of 27 tests failed.

Switch schedulers

In your implementation check the *bool* variable $thread_mlfqs$, you can find it in "threads/thread.c" file. It tells whether the option -mlfqs was passed to the kernel. If true, use the advanced scheduler. If false, use the simple priority scheduler.

Fixed-point real

Variables $load_avg$ and $recent_cpu$ are real numbers. Usually, there is no float operations in the kernel. Fixed-point real variables are a solution implemented using integers. You can use the header file "fpr_arith.h" available on iCorsi.
